

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in this application.

CLAIMS:

- 1.(Currently Amended) A mobile station comprising:
a processor; and
a user input mechanism ~~operable to cause~~ for causing the processor to extract at least one feature from a digital media sample, said feature being descriptive of an identity of a content of said media sample.
- 2.(Original) The mobile station of claim 1 wherein said user input mechanism is enabled to initiate different functions at different times, one such function being to cause the processor to extract the at least one feature.
- 3.(Original) The mobile station of claim 1 wherein said user input mechanism comprises a dedicated button having a single function of causing the processor to extract the at least one feature.
- 4.(Currently Amended) The mobile station of claim 1 further comprising a transmitter coupled to said processor, wherein a single user input at the input mechanism ~~operates to cause~~ the processor to extract the at least one feature, to cause the processor to initiate a wireless link to a network, and to cause the transmitter to transmit the at least one feature over the initiated wireless link.
- 5.(Original) The mobile station of claim 4 wherein the single user input causes the transmitter to transmit a message comprising a plurality of features extracted from the digital media sample, wherein the message carries insufficient information from which to reconstruct the digital media sample.
- 6.(Original) The mobile station of claim 4 wherein said link is to a network address of a music recognition service, said network address stored in a storage media of said mobile station.

7.(Original) The mobile station of claim 4 further comprising a receiver and a display interface coupled to one another through said processor, said display interface for displaying an identifier of the media sample in response to receiving a reply message at the receiver over the link from the network, said reply message in response to the transmitted at least one extracted feature.

8.(Original) The mobile station of claim 7 wherein the identifier is a text identifier.

9.(Original) The mobile station of claim 7 wherein the said user input mechanism comprises a first user input mechanism, the mobile station further comprising a second user input mechanism by which a user may send an authorization message over the link directed to purchasing a copy of a media file referenced in the reply message.

10.(Original) The mobile station of claim 9 wherein said authorization message is an authorization to immediately download said copy of the media file to the mobile station over the link that is automatically compiled in response to receiving the reply message.

11.(Original) The mobile station of claim 9 wherein said first and second user input mechanisms comprise a single input mechanism that effects first and second functions, respectively, at different times.

12.(Original) The mobile station of claim 11 wherein said single input mechanism comprises a button that changes from said first to said second function following receipt of said reply message.

13.(Original) The mobile station of claim 11 wherein said single button is enabled to effect only the first and second functions.

14.(Currently Amended) The mobile station of claim 1 further comprising a storage media and a display interface by which a digital media sample stored in the storage media may be selected, said user input mechanism ~~operating to cause~~ for causing the processor to extract at least one feature from a digital media sample stored in the storage media.

15.(Canceled)

16.(Currently Amended) A mobile station comprising:
a transducer to receive an analog media sample;
a processor to derive a digital media sample from the analog media sample;
a buffer memory, disposed between said transducer and said processor, to temporarily store at least a portion of the digital media sample; and
a user input mechanism ~~operable to cause~~ for causing the processor to extract at least one feature from at least the portion that is temporarily stored in the buffer memory, wherein the feature is descriptive of an identity of a content of said media sample.

17.(Currently Amended) The mobile station of claim 16 wherein said user input mechanism is ~~operable to cause~~ for causing the buffer to so temporarily store and the processor to so extract upon a single user input.

18.(Previously Presented) The mobile station of claim 16 further comprising:
means to receive the digital media sample from which the processor extracts the at least one feature, and
a display interface to display a symbol corresponding to the derived digital media sample.

19.(Currently Amended) A mobile station comprising:
a processor;
a user input mechanism ~~operable to cause~~ for causing the processor to extract at least one feature from a digital media sample, said feature being descriptive of an identity of a content of said media sample;
means to receive a first digital media sample;
a display interface to display a symbol corresponding to the first digital media sample;
and
a transducer to receive and convert an analog media sample to a second digital media sample,
wherein the user input mechanism ~~operates to cause~~ is for causing the processor to extract at

least one feature from the first digital media sample when the displayed symbol is selected by a user of the mobile station, and from the second digital media sample when no displayed symbol is selected by the user.

20.(Original) A user interface of a portable electronic device comprising:

a user input mechanism enabled to cause a processor internal to the device to extract a plurality of features from a digital media sample, and to cause the plurality of extracted features to be transmitted outside the device, upon a single user entry at the user input mechanism; and

a display screen to display, automatically in response to the device receiving a reply message to the plurality of extracted features that is transmitted, a text identifier of a media file having features that exactly match the plurality of extracted features,

wherein the plurality of extracted features are descriptive of an identity of a content of said media sample.

21.(Original) The user interface of claim 20 wherein the user input mechanism is further enabled to cause an authorization message to be transmitted outside the device following receipt of the reply message, said authorization message comprising:

a media file identifier received in the reply message, and
a request to download to the device a copy of said media file.

22.(Currently Amended) The user interface of claim 20 wherein the plurality of extracted features are transmitted in a message from which the digital media sample ~~may not~~ cannot be reconstructed.

23.(Currently Amended) A mobile station comprising:

input means for receiving a media sample;

processing means for extracting at least one feature from a digital version of said media sample, said feature being descriptive of an identity of a content of said media sample; and

user input means for causing the processing means to so extract.

24.(Previously Presented) The mobile station of claim 23, wherein the processing means

comprises a computer processor.

25.(Previously Presented) The mobile station of claim 23, further comprising transmitting means, and the user input means further are for causing the transmitting means, automatically following the processing means extracting the at least one feature, to transmit a message that comprises the at least one extracted feature.

26.(Previously Presented) A program of machine-readable instructions, tangibly embodied on an information bearing medium within a mobile station and executable by a digital data processor, to perform actions directed toward analyzing a media sample, the actions comprising:

in response to a user input, extracting features from a digital version of a media sample and causing a transmitter to wirelessly transmit the extracted features.

27.(Previously Presented) The program of machine readable instructions of claim 26, where the features are extracted and the transmitter is caused to wirelessly transmit in response to the same user input.
